

## **Create a Smarthome with your Smartphone – ayControl®, the iPhone and iPad KNX control**

**The easy-to-use iPhone and iPad software ayControl enables you to intuitively control heating, alarm, lights and other technical devices.**

Vecolux offers KNX products and solutions for home and building control in Belgium and the Netherlands. The visualization of KNX has become a big and important issue. New technologies are developed and the possibility of controlling your KNX building via mobile devices is an upgrade for every smarthome. Therefore we will offer an extra service and set an priority of controlling KNX via ayControl®, the mobile control for iPhone, iPad and iPod touch.

The ayControl app does not just fulfill simple tasks like regulating the heaters, switching the lights, setting the alarm or controlling multi-media devices. One specialty of ayControl is the possibility to set „moods“. „If I tab on „breakfast“ the app switches on the lights in the kitchen. It pulls up the blinds and makes the radio play my favorite music“, explains ayControl inventor Rudolf Schamberger. Furthermore ayControl enables its users to see the people standing in front of one’s gates or garage entries. And all these features are not only accessible at home. Via GSM, UMTS and WLAN they can be used from virtually everywhere. The only requirement for the installation of ayControl is a working EIB/KNX bus system. (No expensive and complex servers are necessary.)

For the team of Vecolux it is very important to offer their customer new technologies and in addition with ayControl comfort and security.

Please contact us for information about the ayControl courses.
